

# How much money will you save?

When you use SofTrack you quickly gain control of your software acquisition and maintenance expenditures while reducing your risk of copyright infringement.

**SofTrack is an enterprise software audit and control platform that can help you:**

- Quickly identify the number of workstations where software is installed and is **not** used.
- Eliminate the risk of copyright litigation by prohibiting unauthorized application installations. Your users will no longer be able to install any software without your prior consent. *This includes surreptitious .EXE creation and/or modification by email viruses!*
- Receive up-to-the minute reports of any application or .EXE file created or modified anywhere in your enterprise.
- Ensure stability of your infrastructure by disallowing modifications of application executables including those attempted by viral means.
- Discover every application launched.
- Audit every file opened and every page requested by any browser.
- Audit every file created including the requesting process.
- Manage Application purchase records, installations, use and more.

Since 1988, SofTrack has served over 14,000 customers around the world across a wide range of industries large and small, including educational, financial services, energy, chemical, industrial, healthcare, legal, insurance and government.

SofTrack is designed for use on any Windows-based workstation, any Macintosh using OS9 or OSX and all versions of Windows Terminal Server with any thin client. SofTrack interoperates with all versions of Windows® and NetWare servers®.

# SofTrack<sup>®</sup>

## Enterprise software audit and control platform

### SofTrack's Features and Benefits include:

- **Quickly identify the number of workstations where software is installed and is not used.**

SofTrack's smart inventory function will quickly identify (usually less than 10 seconds per workstation) the applications installed on each of your workstations and then via its patent-pending technology derive those applications' EXE files. Next, via our local workstation agent, use of those EXE files is tracked yielding a report of where software is installed and used and not used.

By knowing where software is installed and in-use, you gain control over your software license expenditures. Now you can renew or upgrade just those software licenses that are actually used and uninstall those that are unused.

And, if you find that you have more copies of the software installed than you have purchased licenses for, SofTrack's smart inventory can help you avoid a copyright infringement lawsuit, with fines as up to \$150,000 per infringement<sup>1,2</sup>, by identifying where the software is installed and in-use. This allows you to decide whether you need to purchase more licenses or uninstall unused copies of the software.

SofTrack's smart inventory function also includes a hardware inventory of your workstations.

- **Metering and Inventory for Macintosh.**

SofTrack's local agent technology provides world-class active and passive metering of all your Macintosh applications for your Mac OS9 and OSX workstations. You can even combine Windows and Macintosh application licenses to be shared between users on both platforms! SofTrack's inventory features listed above are also available for your Macintosh OS9 and OSX workstations.

- **Prohibit unauthorized application installations.**

SofTrack's local workstation agent can be configured to disallow creation or modification of .EXE files by any means. Because this agent works at the system level it can deny creation and changes to .EXE files by any application. This even prevents viruses from creating or modifying applications. And, this means your users will no longer be able to install applications without your approval. This limits your exposure to copyright infringement lawsuits, with fines as up to \$150,000 per infringement 1, 2, due to over installation of licensed software.

When you lockdown unauthorized application installation you gain control over what software is installed. This has the added benefit of reducing calls to your helpdesk for problems related to unauthorized software installations. If your environment includes persons creating .EXE files, for instance, university students in a computer science course, the local workstation agent can be configured to allow creation of .EXE files by selected processes while disallowing all other .EXE creations or modifications.

- **Receive up-to-the minute reports of .EXE file creation or modification.**

SofTrack's local workstation agent can be configured to track all .EXE file creation and modification. This gives you the power to quickly know when executable files are being added or changed.

- **Discover every application launched.**

SofTrack's local workstation agent can be configured to track every .EXE file launched. This allows you to know what software your users are working with, and can even be referred to by your helpdesk staff to know what your users were doing before calling the helpdesk.

- **Software Metering.**

SofTrack provides world-class active and passive software metering for all your applications, custom and commercial. Benefits include: idle detection and optional termination; timekeeping prompting for billing individual application use; sharing of licenses throughout your enterprise; and, full reporting of metered software use.

- **Audit every page requested by any browser.**

SofTrack's local workstation agent can be used to track every web page requested by any browser, IE, firefox, etc. This tracking is unrestricted meaning it watches every action including those considered "local" that do not go through your firewall. When you combine this audit option with application launch, file open and file create tracking, you will have a very good idea of how your users are spending their time.

- **Audit every file opened and every file created including the requesting process.**

SofTrack's local workstation agent can be configured to record every file opened regardless of the process used to open the file. The local agent can also track every file created including the process that created the file and can even detect when a file is being copied!

- **Managed Applications put you in control of your licenses and compliance purchase records.**

SofTrack's Managed Applications feature combines your workstation's inventory with your purchase records in a flexible and configurable database. Quickly determine upcoming renewal and other important dates. Collect, gather and store all your important application license compliance records in a single view. With a single click calculate real-time violations.
